

Drought Report for the Week of November 9, 2015

Looking back on the 2015 water year, records were set for lowest snowpack level and earliest melt dates since the state began record keeping more than 30 years ago. Stream flow for the 2015 water year was only 65 percent of average. In many locations, summertime stream flows were at the lowest levels ever recorded. In many cases, reservoir levels were also the lowest ever recorded. Streamflow conditions for October, 2015 were 51 percent of average.

Governor Brown issued Executive Orders declaring drought in 25 counties. In recent years, these declarations have been set to expire at the end of the calendar year. These declarations allowed the Water Resources Department to issue emergency drought permits to applicants, using an expedited process.

Cooler temperatures and recent rainfall have helped to lower water demand in recent weeks and as a result, streams have responded with a moderate upward trend. Despite this, 60 percent of Oregon is still under “Extreme Drought” conditions according to the U.S. Drought Monitor. Reservoirs, especially in Eastern Oregon remain at extremely low levels.

The Climate Prediction Center has issued an El Nino advisory, stating; “There is an approximately 95% chance that El Niño will continue through Northern Hemisphere winter 2015-16, gradually weakening through spring 2016.” For Oregon, this means a high probability of warmer than normal temperatures and an uncertain precipitation outlook. This means that it is likely that there will be less than normal snowpack in the coming winter.

OREGON SURFACE WATER SUPPLY INDEX (SWSI)

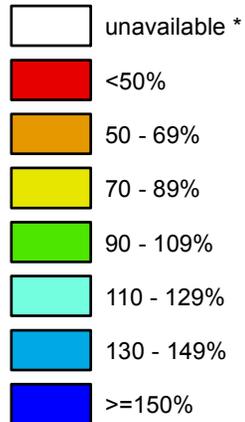

As of October 1, 2015

Oregon SNOTEL Water Year (Oct 1) to Date Precipitation % of Normal

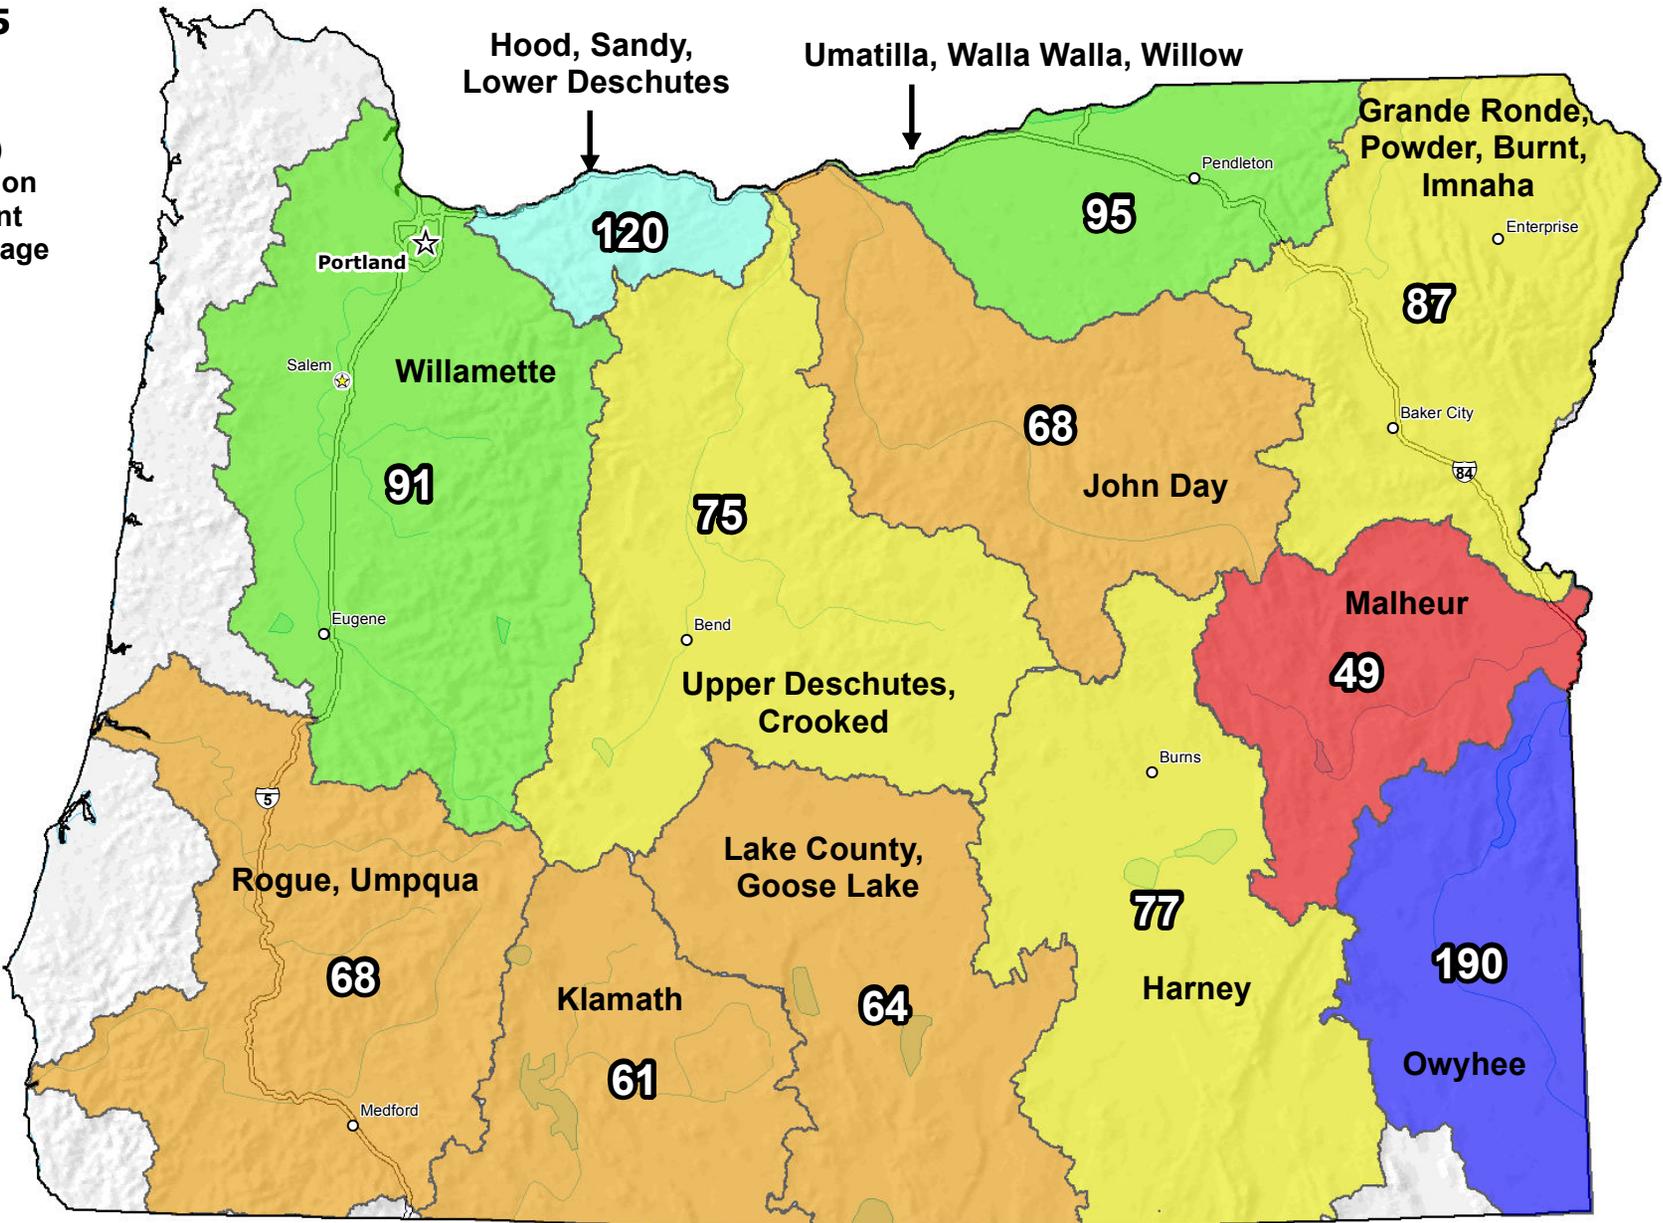

Nov 09, 2015

Water Year (Oct 1) to Date Precipitation Basin-wide Percent of 1981-2010 Average

* Data unavailable at time of posting or measurement is not representative at this time of year

**Provisional Data
Subject to Revision**

The water year to date precipitation percent of normal represents the accumulated precipitation found at selected SNOTEL sites in or near the basin compared to the average value for those sites on this day. Data based on the first reading of the day (typically 00:00).

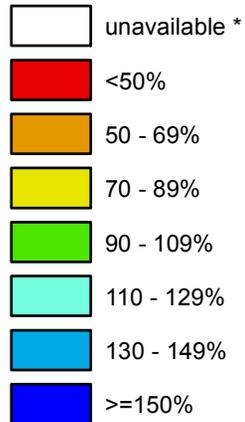

Prepared by:
USDA/NRCS National Water and Climate Center
Portland, Oregon
<http://www.wcc.nrcs.usda.gov>

Oregon SNOTEL Current Snow Water Equivalent (SWE) % of Normal

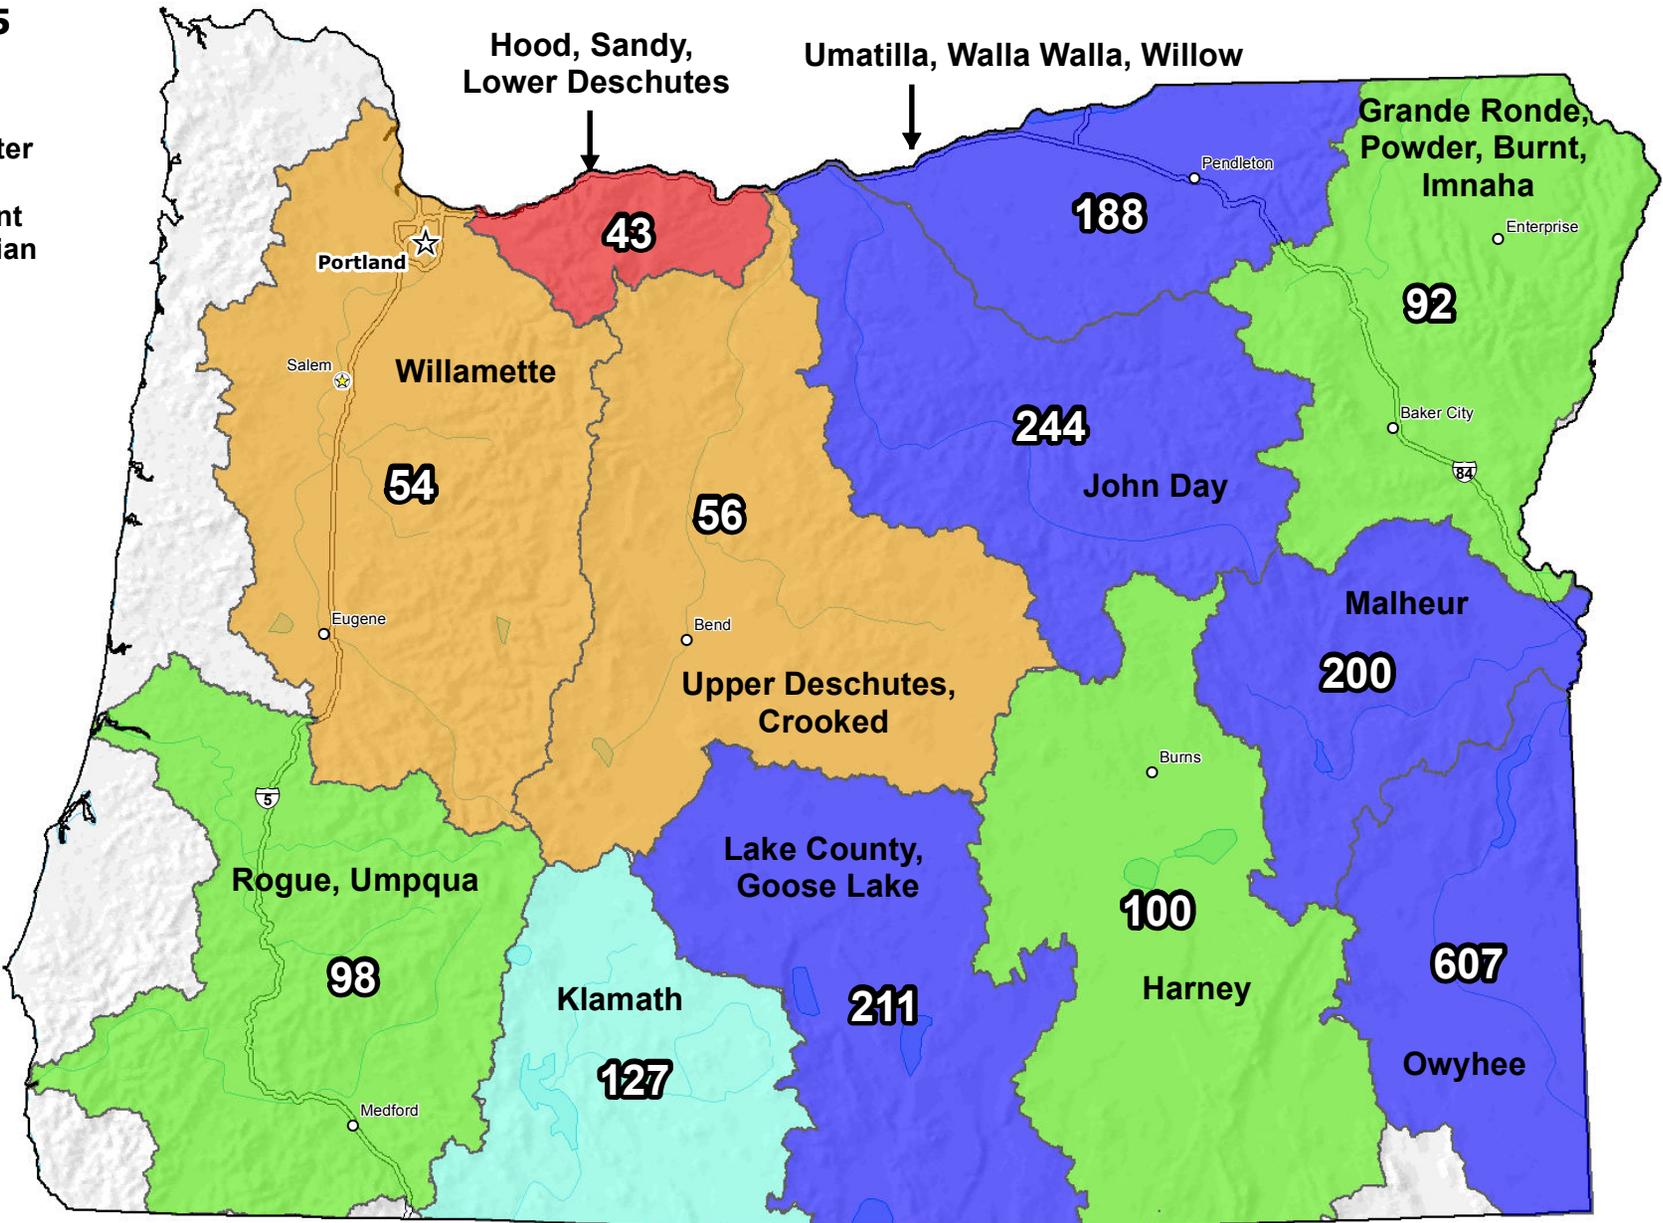

Nov 09, 2015

Current Snow Water Equivalent (SWE) Basin-wide Percent of 1981-2010 Median

* Data unavailable at time of posting or measurement is not representative at this time of year

**Provisional Data
Subject to Revision**

The snow water equivalent percent of normal represents the current snow water equivalent found at selected SNOTEL sites in or near the basin compared to the average value for those sites on this day. Data based on the first reading of the day (typically 00:00).

U.S. Seasonal Drought Outlook

Drought Tendency During the Valid Period

Valid for October 15 - January 31, 2016
Released October 15, 2015

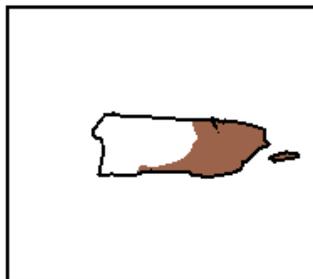

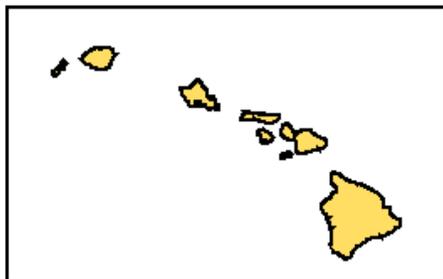

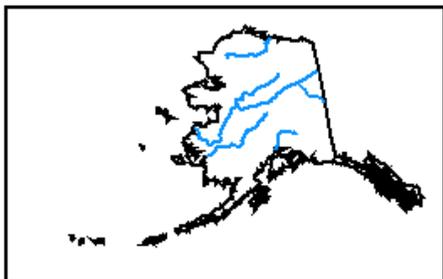

Depicts large-scale trends based on subjectively derived probabilities guided by short- and long-range statistical and dynamical forecasts. Use caution for applications that can be affected by short lived events. "Ongoing" drought areas are based on the U.S. Drought Monitor areas (intensities of D1 to D4).

NOTE: The tan areas imply at least a 1-category improvement in the Drought Monitor intensity levels by the end of the period, although drought will remain. The green areas imply drought removal by the end of the period (D0 or none).
